#### TEEN VACCINES

# INFORMATION FOR PARENTS

#### $\mathbf{M}_{ ext{eningococcal}}$

Vaccines (MenACWY, MenB)

Meningococcal vaccines protect against meningitis, which affects the brain and spinal cord.

If your child contracts meningitis, it can cause brain damage, severe disabilities or death.

Common symptoms include a fever, rash, headache, or stiff neck.

It is spread through close contact with an infected person, such as coughing, kissing, and sharing food or drinks. This disease is easily spread.

MenACWY is given at 11-12 years of age with a second dose at 16. MenB is given at 16-18 years of age in a series of doses. If your child has not received these vaccines, talk to their health care provider today.

### Adolescent Catch-Up

Many vaccines are given during childhood to give life-long protection against diseases.

If your child has not received all of the below vaccines, it is not too late!

- 3 doses of hepatitis B vaccine (Hep B)
- 2 doses of hepatitis A vaccine (Hep A)

2 doses of measles, mumps, rubella vaccine (MMR)

2 doses of varicella (chickenpox) vaccine

At least 3 doses of polio vaccine (IPV or OPV)

Flu vaccine every year

These vaccines are important, especially if your child plans to travel. All doses are needed for full protection.

#### l etanus, Diphtheria, Pertussis (Tdap)

Tdap vaccine protects your child against pertussis (whooping cough), diphtheria, and tetanus.

Tetanus causes painful tightening of the muscles and is very serious. It is found in soil and enters the body through a cut or wound.

Diphtheria can make it hard to breath or move body parts. It is spread by coughing or sneezing.

Pertussis can cause severe coughing and choking, making it difficult for your child to breathe or eat. It is spread by coughing, sneezing or close contact with an infected person.

Tdap vaccine is usually given at the 11-12 years of age. However, anyone who has not had Tdap vaccine needs a dose.

## Human Papillomavirus (HPV)

HPV vaccine protects against cervical cancer in women and genital warts in men and women. It also protects against anal, penile, vaginal and vulvar cancers.

HPV is a common infection transmitted by skin-to-skin contact. Even if your child does not have sexual intercourse, they can still get HPV. HPV infection often has no symptoms so a person could have it and not know.

The best time to get HPV vaccine is at 11-12 years of age, well before sexual activity starts. If the series is started before age 15 years, only 2 doses are needed. Individuals can be vaccinated through 26 years of age.

This vaccine is safe, effective, and prevents several types of cancers.
